

Support for Dyslexic Students and Parents

For many people with dyslexia, the use of coloured overlays while reading can mitigate a range of visual perceptual problems, often collectively referred to as Meares-Irlen Syndrome, which is particularly prevalent in people with dyslexia.

Did you know? Coloured overlays help Dyslexics and those with Irlen Syndrome by making text visually clearer and more comfortable to see! When using paper, we can use coloured paper or overlays, but unfortunately, this isn't possible when using a computer screen working from home.

<https://www.aurelitec.com/colorveil/windows/>

Here is a free download which is a colour veil for computers.

What does this do?

- Customizable colour filter for screens so they can browse as usual with a coloured veil (this reduces eye strain)
- Can help people with Dyslexia and SSS.
- Easy to switch on and off.
- Doesn't need to be downloaded can just be unzipped at location.
-

Please see example below:
